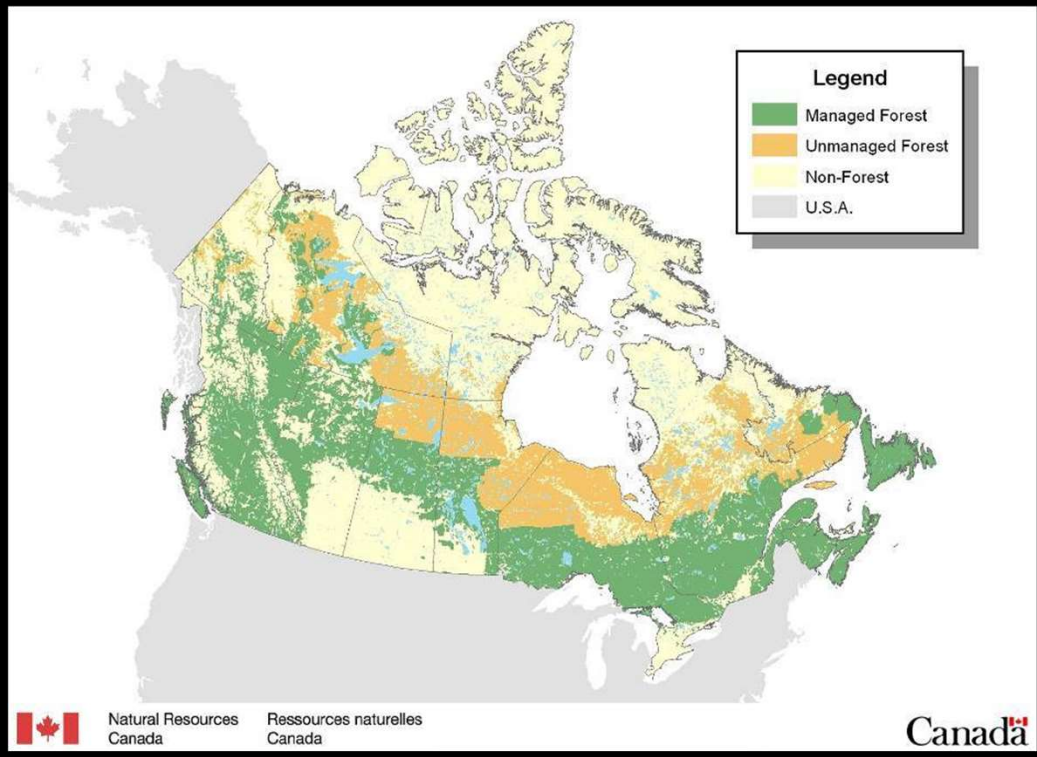
Forest Carbon

4.4 M km2

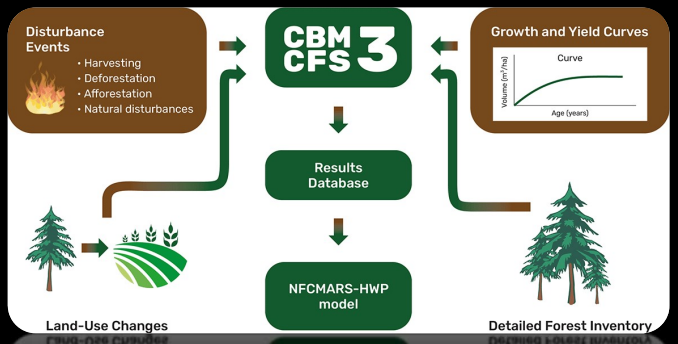
3.6 M km2 – all forests
2.3 M km2 – managed forests

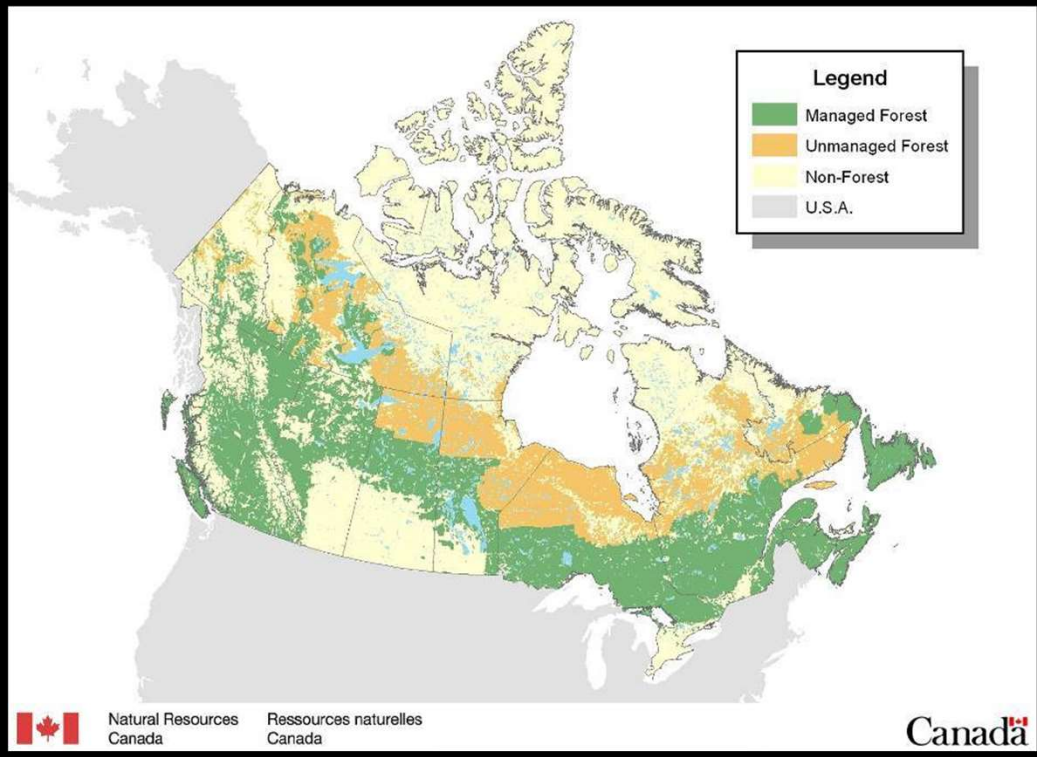


Forest Carbon

4.4 M km2

2.3 M km2 – managed forests



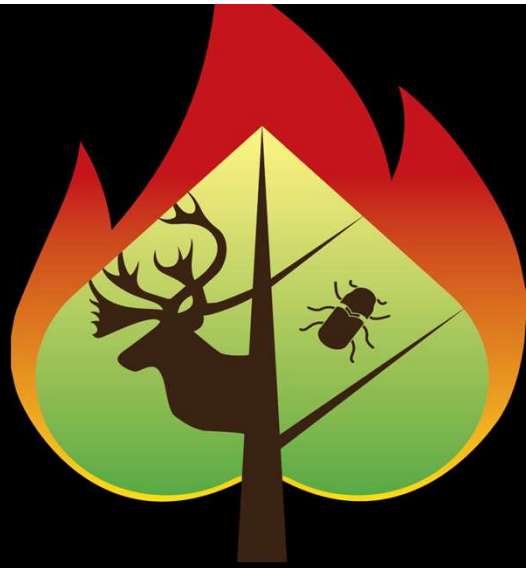


Forest Carbon in SpaDES

November 19-21, 2024

Forest Carbon

Forest management decisions - *Challenges*



- Changing the paradigm:
  - **there is no right answer**, we need all the models, all the information/data.
  - Test and validate current models and estimates.
  - Integrating TEK and social sciences.

- Updating/re-structuring models for transparency and linkages
- Testing new data and algorithm – models are not nimble yet!
- Technical support for modelling (CFS was a field organization)

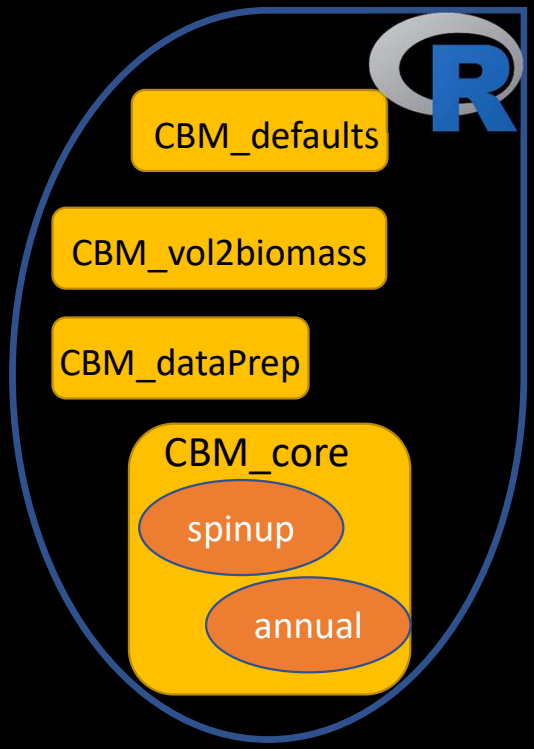
Improving C-modelling: current R&D

- At the core of our international obligations
- Rapidly evolving science (new data, concepts)
- Under intense internal and external scrutiny.

Improving C-modelling: current R&D

- Common problem in ecological modelling: difficult to get a handle on the model, difficult to update, etc.
- Scientific uncertainty.
- Forest carbon is really an emergent property to forest dynamics.

Improving C-modelling: current R&D



Spatial **D**iscrete **E**vents **S**ystem ***SpaDES***

- Modular
- Transparent

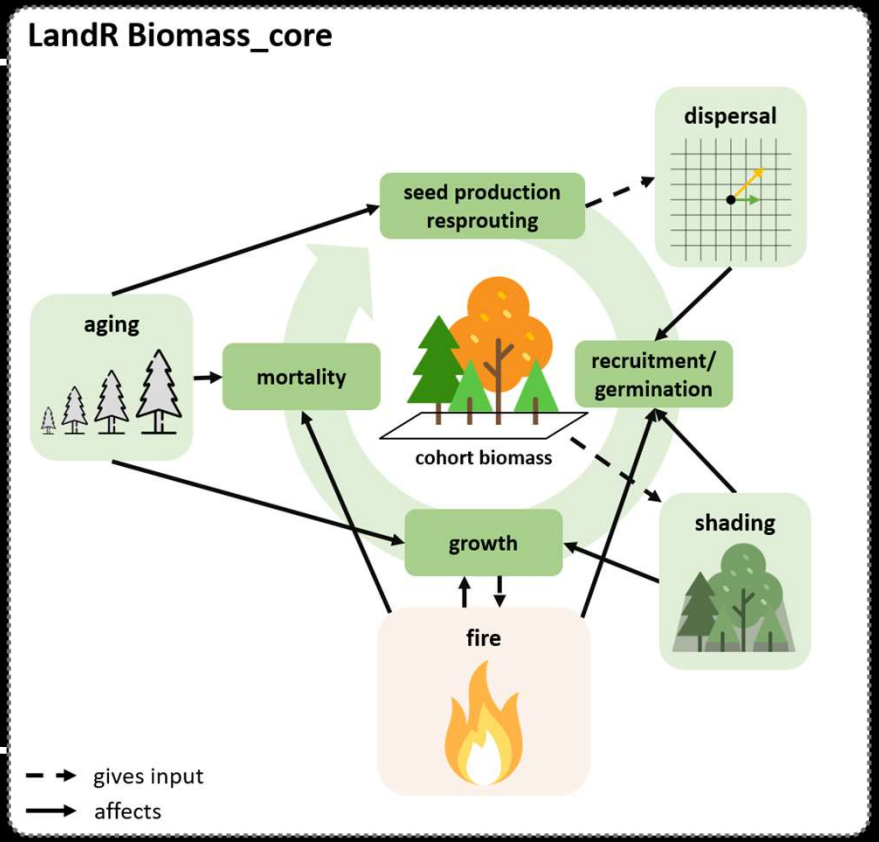
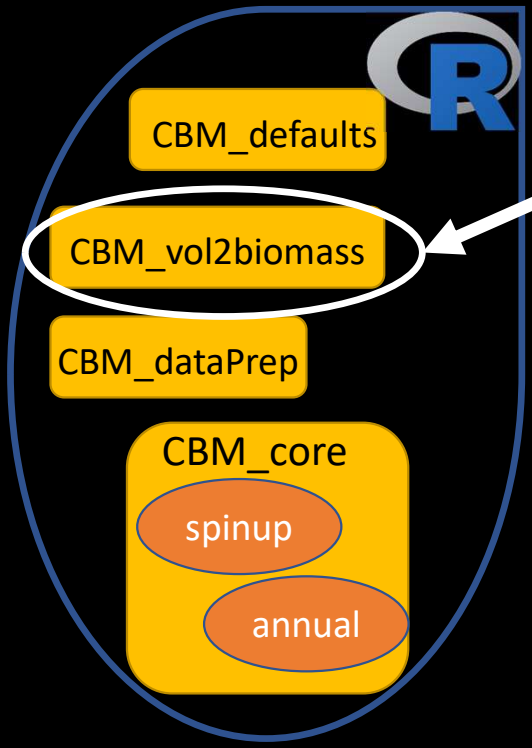
Increments

Biomass increments *emergent phenomenon by cohort*



Improving C-modelling: current R&D



Increments

Biomass increments

Cohort: combination of tree species and age. Multiple cohorts form a stand/pixel.

Data-adjusted trait-based biomass accumulation

LandR Biomass_core

- LandR Biomass_core (vegetation simulator) is based on the LANDIS II Biomass Succession Extension, recoded in R using the SpaDES toolkit
- Parameters are fit to available data (biomass, species distribution, PSP for growth)
- CS growth (Luo et al, 2019)
- Simulations under CC for western boreal region (planned for eastern boreal)
- Unmanaged forest included.
